

TakeOff — Wireframes

Team TakeOff (Team 1) — INFO 490, Part 3: Ideas & Wireframe

AI / Tool Usage Disclosure

The low-fidelity wireframes in this document were generated with the assistance of a large language model, based on the screen list, features, and layout requirements specified by the team. The team reviewed and directed the content of every screen; no visual design system, brand assets, or production UI was used — all boxes, labels, and placeholder text are intentionally low-fidelity.

- Tool / Model:** Claude (Anthropic) — Claude Opus 5, via claude.ai
Version: claude-opus-5
Earlier revision: Claude Sonnet 5, via Claude (Cowork) — the initial ten-screen draft

Contents

- 10. Pre-Trip: Packing & Reminders
- 11. Post-Trip: Photo Journal & Memories
- 12. Community Hub (Planned & Completed)

Design Documentation & Rationale

REVISION NOTE

This deck supersedes the earlier ten-screen draft. Three changes were made after review: a Login / Sign Up screen (Screen 2) was added, since domain verification appeared in the feature notes but had never been drawn; a route-sequencing step (Screen 5) was inserted between Trip Input and Planning, because city order and nights-per-city are prerequisites for every downstream category rather than peers of them; and the category tabs on Screen 6 now carry their own completion state.

takeoff.app/screenflow-overview

Solid arrows = primary linear flow. Dashed lines = optional branches reachable once an itinerary exists.

CONDITIONAL BEHAVIOUR OF THE ROUTE SCREEN
1 destination → screen is skipped entirely; the day count carries straight through to planning. 2 destinations → collapses to an inline order/nights widget at the foot of Trip Input. 3+ destinations → shown as a full screen. Most trips therefore never see an extra page.

PAGE PURPOSE

Shows the primary path a user takes through TakeOff and where the flow branches into optional support and community features.

KEY UI ELEMENTS

Flow nodes, solid arrows for the linear path, dashed arrows for optional branches, conditional-behaviour note.

INTENDED INTERACTIONS

Reading only. The route node is shaded because it is conditional; the note states when it is shown or skipped.

you@university.edu — .edu domain, will be verified

you@gmail.com — no badge, account still works

Verified badge

Priya N. ✓

verified · illinois.edu

Accounts that register with a recognised .edu or company domain receive a blue verified tick after a confirmation link is clicked. The badge appears next to the display name everywhere the user is visible: community trip posts, join requests, and in-app messages.

What it does and does not mean

- Confirms the person controls an email at that institution or company
- Does NOT vouch for their behaviour
- Not required to use the app — planning works fully without it

Unverified accounts can still plan, save and book. The badge only affects the community layer, where posters may filter join requests to verified travellers.

PAGE PURPOSE

Account entry point. Registering with a .edu or company domain earns a verified tick, which is the trust signal the community layer relies on when strangers plan a trip together.

KEY UI ELEMENTS

Email and password fields, sign-in / create-account toggle, third-party sign-in options, live domain-verification feedback, badge explanation panel.

INTENDED INTERACTIONS

User signs in or creates an account; a recognised institutional domain triggers a confirmation email, and the badge is granted once the link is clicked. Verification is optional and can be added later.

PAGE PURPOSE

Entry point for planning a trip: search bar, personalised recommendations, and community-posted trips shown with a distinct badge.

KEY UI ELEMENTS

Header search bar, sign-in/profile buttons, horizontally scrollable recommendation card rows, community-trip badge cards.

INTENDED INTERACTIONS

User types or selects destination/dates in the search bar to start planning; taps a card to view or copy that trip; badge cards distinguish community content from app-generated suggestions.

Plan your trip

Continue →

Suggested alternatives (route / budget)

- Option 1: Milan → Venice → Florence → Rome

10 nights · est. \$1,840
- Option 2: Rome → Florence → Venice → Milan

10 nights · est. \$1,910
- Option 3: Milan → Florence → Rome

8 nights · est. \$1,510

IF EXACTLY 2 DESTINATIONS

the route screen collapses into an inline widget here: two draggable rows with nights steppers, so no extra page is added for short trips.

PAGE PURPOSE

Collects trip parameters through selectors rather than free typing, and surfaces alternative route and budget options before the user proceeds.

KEY UI ELEMENTS

Dropdown/map-pin pickers, ordered multi-select, calendar range picker, budget slider, group-size stepper, companion checkbox, alternatives panel.

INTENDED INTERACTIONS

User fills selectors with minimal typing, toggles companion search, reviews alternatives, then continues. Two-city trips resolve their order inline here instead of on a separate screen.

takeoff.app/review-your-route

Here's a suggested route — drag to reorder, adjust nights with – / +

Milan → Venice → Florence → Rome · 10 nights · est. \$1,840 per person

1. Milan

arrive MXP · flight lands 09:25

– 2 nights +

2. Venice

train from Milan · 2h 25m

– 2 nights +

3. Florence

train from Venice · 2h 05m

– 3 nights +

4. Rome

train from Florence · 1h 30m · depart FCO

– 3 nights +

IF THE USER REORDERS — non-blocking note appears:

“Your order: +3h travel time, +\$60 in transit vs. suggested.” [Use suggested] [Keep mine]

Looks good →

Add another city

Why this order

Suggested route minimises total transit: 5h 55m by rail, all daytime legs, and it opens and closes at the two airports with the cheapest fares on your dates.

What this screen decides

• City order (which city follows which)

• Nights per city (how the days are split)

Both are needed before planning: transport depends on the sequence, hotels are priced per city per night, and activities can only be placed once days exist.

Skipped when

• 1 city — screen not shown at all

• 2 cities — inline widget on Trip Input

• 3+ cities — full screen (this one)

PAGE PURPOSE

Resolves city order and nights per city in one step, before any category planning begins, so that later reordering never invalidates choices the user has already made.

KEY UI ELEMENTS

Drag-handle route rows, per-city nights stepper, non-blocking optimisation note, single primary 'Looks good' action, secondary 'Add another city'.

INTENDED INTERACTIONS

User lands on a pre-solved route and can accept it in one tap; dragging a row re-ranks the cities and surfaces the estimated cost of the change, which the user is free to ignore.

SCREEN BOUNDARY: this screen decides WHAT goes in the trip. The day-wise itinerary decides WHEN. No time pickers here; no brand-new options there, only an 'add from saved' drawer.

View Day-wise Itinerary →

PAGE PURPOSE

Lets users build the trip across categories with filters, sorting and hidden-gem discovery. Each category tab reports its own completion state rather than appearing equally ready.

KEY UI ELEMENTS

Left filter rail, category tabs with per-tab state counts, recommendation card grid with Add buttons, screen-boundary note, floating 'View Itinerary' button.

INTENDED INTERACTIONS

User works the categories in any order, applies filters, adds items to the trip basket, then opens the day-wise itinerary where those items are placed onto days and times.

takeoff.app/day-wise-itinerary

Your basket, laid across days — tap any item to edit, drag to re-slot

Day 1 · Milan

09:25 – Flight lands MXP

edit

15:00 – Hotel near Centrale

edit

19:00 – Aperitivo in Navigli

edit

Day 2 · Milan

10:00 – Duomo rooftop terraces

edit

13:00 – Lunch — open slot

edit

18:00 – Free

edit

Day 3 · Venice

09:25 – Frecciarossa to Venice

edit

14:00 – Libreria Acqua Alta

edit

18:30 – Cicchetti crawl

edit

ADD FROM SAVED: items are placed here from the basket built on Screen 6. New options are not introduced on this screen — a drawer lists what was already saved, so the two screens never duplicate each other's job.

PAGE PURPOSE

Presents the trip as a clickable day-by-day schedule so users can review it and jump into editing any item.

KEY UI ELEMENTS

Day-section headers, time-blocked item cards with edit affordances, 'add from saved' drawer, horizontal scroll per day.

INTENDED INTERACTIONS

User taps an item card to open its edit panel, drags to re-slot within or across days, and scrolls vertically between days.

Itinerary summary (editable)

Milan → Venice → Florence → Rome · 10 nights · 15 items · 4 booked

ORD → MXP overnight flight	Booked	edit
Hotel near Centrale, Milan	Booked	edit
Frecciarossa Milan → Venice	Partially booked	edit
Guesthouse in Oltrarno, Florence	Partially booked	edit
Uffizi Gallery timed entry	Not booked	edit
Colosseum underground tour	Not booked	edit

Partial bookings keep the trip editable — nothing locks until every item is marked booked.

Actions

Save Privately

only you can see it

Post for Others to Join

sets seats open, accepts join requests

Book Now

opens third-party links, Screen 9

PAGE PURPOSE

Final review of the day-wise itinerary with clickable items and the choice to save privately, post publicly, or proceed to booking; tracks partial bookings.

KEY UI ELEMENTS

Editable item list with per-item status tags, three clearly separated action buttons with the primary action visually distinguished.

INTENDED INTERACTIONS

User edits or removes items inline and picks one of the three actions; partially booked trips remain editable until every item is marked booked.

takeoff.app/booking-links-&-status

Book Now — compare third-party options

Booking happens off-platform. TakeOff never takes payment; it tracks what you have completed.

ORD → MXP 16 May, overnight	Provider A \$780 Go →	Provider B \$812 Go →	Provider C \$798 Go →	☒ Mark as booked
Hotel near Centrale 16–18 May, 2 nights	Provider A \$190 Go →	Provider B \$205 Go →	Provider C \$188 Go →	☒ Mark as booked
Uffizi Gallery 22 May, 09:00 entry	Provider A \$28 Go →	Provider B \$31 Go →	Provider C — Go →	☐ Mark as booked

PARTIAL BOOKING: an item can be marked partially booked when the booking is incomplete. The itinerary remains editable until all required bookings are completed.

PAGE PURPOSE

Shows several third-party booking links and prices per itinerary item; booking happens off-platform and users mark items booked, including partially, once done.

KEY UI ELEMENTS

Per-item provider comparison cards with external-link buttons and a 'Mark as booked' checkbox per item.

INTENDED INTERACTIONS

User taps a provider's 'Go' link to book off-platform, returns to TakeOff, and checks 'Mark as booked' to update itinerary status.

Packing checklist (auto-suggested)

Derived from destination, dates, forecast, and what is actually on your itinerary.

☐	Passport / ID	international trip
☐	Weather-appropriate clothing	14–19 °C, rain on day 3
☐	Chargers & adapters	Type C/F sockets in Italy
☐	Itinerary printouts	timed Uffizi entry
☐	Medication	always suggested
☐	Comfortable walking shoes	6 walking activities booked

Weather (destination, dates)

Milan	16–18 May	17 °C	partly cloudy
Venice	19–20 May	14 °C	rain expected
Rome	24–26 May	22 °C	clear

Reminders

Flight check-in opens in 18 hrs
Uffizi entry is timed — arrive 09:00
Venice train tickets still unbooked

Notification settings

on / off

PAGE PURPOSE

Optional packing recommendations based on destination, weather and itinerary, plus trip reminders and checklists before and during the trip.

KEY UI ELEMENTS

Checklist items with checkboxes and a short reason per item, weather widget, reminder cards, notification toggle.

INTENDED INTERACTIONS

User checks off packed items, reviews auto-populated weather and reminders, and toggles notifications on or off for the trip.

Request to Join

Message

POSTER CONTROL: the trip owner accepts or declines each request, can update the post, and can close it. Messaging happens in-app so no personal contact details are exchanged before both sides agree.

PAGE PURPOSE Community area with two sub-tabs: planned trips open for join requests, and completed trips shared as memories. Posters control acceptance and can update or close posts.	KEY UI ELEMENTS Planned/Completed sub-tabs, trip post cards with seats-available count and verified-poster label, 'Request to Join' and 'Message' buttons.	INTENDED INTERACTIONS User switches tabs to browse open versus past trips, requests to join or messages the poster in-app before personal details are shared; the poster accepts or declines.
---	---	--

Design Documentation & Rationale

Overview of design choices

The wireframes favour selectors, cards, and tab bars over free-text input, since the brief calls for interactive, mostly non-typing input. Every screen keeps the same header and card visual language so users transfer what they learn from one screen to the next.

Sequencing before selection

City order is not a peer of the other planning choices; it is the parent of them. Inter-city transport is defined by the sequence, since $A \rightarrow B \rightarrow C$ and $A \rightarrow C \rightarrow B$ are different tickets. Hotels are priced per city and per night. Activities are bucketed into days, and days only exist once nights are allocated. Resolving order and nights in one step before the category screens means a later reorder never invalidates work already done. The alternative — letting users book three hotels and then drag a city into a new position — forces either silent data loss or a destructive-confirmation dialog.

Trust as a design constraint

The community layer asks strangers to share plans, costs and sometimes a room, so the design needs a trust signal that costs the user almost nothing to obtain. Accounts registering with a recognised .edu or company domain receive a verified tick, shown next to the display name on every trip post, join request and message. The badge is deliberately narrow in what it claims: it confirms the person controls an email at that institution, not that they are a good travel companion. Verification is optional and the planning tools work fully without it, so the requirement never blocks a first-time user; it only gives posters a filter to apply when they choose.

Hick's Law

Trip Input uses a small, fixed set of selectors rather than an open-ended form, reducing decision time by limiting the choices presented at once. Category tabs on the planning screen break one large decision into five smaller ones.

Fitts's Law

Primary actions (Looks good, Book Now, Post for Others to Join, Request to Join, Mark as booked) are large, clearly separated buttons rather than small icons or text links, since these are the actions users need to reach quickly and accurately.

Gestalt principles (proximity & similarity)

Recommendation cards in the same category are grouped tightly and styled identically so they read as one set. Community-posted trips on the Home screen use a distinct fill and badge so they read as a different group from algorithmic recommendations.

Cognitive Load Theory

The day-wise itinerary paginates by day instead of listing everything at once, and the confirmation screen shows only status and edit affordances per item. Placing one structural decision (route and nights) on its own screen also prevents the user from holding route, lodging and activities in mind simultaneously. That screen is conditional: single-destination trips skip it, two-city trips collapse it into an inline widget, and only three-or-more-city trips see it in full.

Recognition over recall (Nielsen)

The route screen opens on a pre-solved suggestion rather than an empty ordering task. The user recognises and confirms a proposed route in one tap instead of constructing one, and the reasoning behind the suggestion is shown alongside it rather than hidden.

User control and freedom (Nielsen)

When a user reorders the cities, the screen states the concrete cost of their version against the suggestion — for example '+3h travel time, +\$60 in transit' — and does not block the change. Users may have reasons the system cannot see, such as a friend in a city or a market that runs on Tuesdays, so the note advises once and never nags. Itinerary items likewise remain editable up to the point of booking, and posts can be updated or closed by their owner.

Visibility of system status (Nielsen)

Booking status is always visible as a text tag next to each item. Category tabs report their own state — 'Transport · 3 legs to book', 'Activities · 0 of 6 days planned' — so progress is legible without opening each tab. Seats-available counts and privacy labels are shown, not hidden behind a click.

Consistency and standards (Nielsen)

Identical header, tab, and card patterns are reused across all twelve screens. The two planning screens are given non-overlapping jobs: the category screens decide what goes in the trip, and the day-wise itinerary decides when. Holding that line — no time pickers in the category cards, and no brand-new options introduced on the itinerary, only an 'add from saved' drawer — is what stops the two screens from feeling like the same task performed twice.

Simplicity, accessibility, affordance

Buttons look like buttons (filled, bordered, labelled with a verb) and are distinguished from static cards by fill colour. Text labels favour plain verbs over icons alone for accessibility, and a single grey-scale palette keeps the design intentionally low-fidelity and easy to revise.

Layout & flow justification

The screenflow shows a single primary path (Home → Input → Route → Planning → Itinerary → Confirmation → Booking) with three optional branches — packing and reminders, memories, and community — reachable once an itinerary exists, matching the phased scope of the project.
